

Dear colleagues,

The newly formed Theoretical Biological Physics group at BU (consisting of [Kirill Korolev](#), [Pankaj Mehta](#), and [Daniel Segrè](#)) has multiple openings for group postdoctoral positions.

We are actively seeking postdocs to join our group, and we hope that you will urge any outstanding candidates to apply. Postdocs will have the freedom to choose their own project and work with any/all of our groups. Please see the detailed description below.

Sincerely,

Kirill Korolev
Pankaj Mehta
Daniel Segrè

The Theoretical Biological Physics group at Boston University (Korolev, Mehta, and Segrè) has multiple openings for postdoctoral positions. Postdocs will also be part of the newly formed BU Center for Nonequilibrium Physics and Computation. The interests of the BU theoretical biophysics group span the entire interface of statistical physics, biology, and computation. Postdocs will have the freedom to work with multiple PIs and choose projects of their likings. Postdocs will also be encouraged to collaborate with the growing Quantitative, Systems, and Synthetic Biology community at BU including the new BU Microbiome Initiative, the BU Biological Design Center, the BU Bioinformatics Program, the Center for Regenerative Medicine, and the Computational Neuroscience Initiative.

We are looking for individuals with demonstrated and rigorous training in theoretical/computational physics that are passionate about applying this training to tackle difficult biological problems. Prior experience with biology is a plus but we are more than happy to consider outstanding candidates from other branches of physics committed to learning biology.

Interested individuals should send a cover letter, short statement of research interests, CV, and contact information for three references to BUBioTheoryPostdoc@gmail.com.
